                                                                                                                                                                                                                                                                                                                                                     ie complete primary structure of a nematode alpha 2(IV) collagen if the partial structural organization of its gene."; Biol. Chem. 266:16149-16156(1991).

Biol. Chem. 266:16149-16156(1991).

FUNCTION: COLLAGEN TYPE IV IS SPECIFIC FOR BASEMENT MEMBRANES. SUBUNIT: TRIMERS OF TWO ALPHA 1(IV) AND ONE ALPHA 2(IV) CHAIN. TYPE IV COLLAGEN FORMS A MESH-LIKE NETWORK LIKED THROUGH INTERMOLECULAR INTERACTIONS BETWEEN 7S DOMAINS AND BETWEEN NC1
                                                                                                    PRODUCED BY ALTERNATIVE SPLICING.

DOMAIN: ALPHA CHAINS OF TYPE IV COLLAGEN HAVE A NONCOLLAGENOUS DOMAIN (NC1) AT THEIR C. TERMINUS, FREQUENT INTERRUPTIONS OF THE G.X.Y REPEATS IN THE LONG CENTRAL TRIPLE-HELICAL DOMAIN (WHICH W CAUSE FLEXIBILITY IN THE TRIPLE HELIX), AND A SHORT N-TERMINAL TRIPLE-HELICAL 75 DOMAIN.

PYM: PROLINES AT THE THEND POSITION OF THE TRIPEPTIDE REPEATING UNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS. PYM: TYPE IV COLLAGENS CONTAIN NUMEROUS CYSTEINE RESIDUES WHICH ARE INVOLVED IN INTER- AND INTERMOLECULAR DISULFIDE BONDING. 12 THESE, LOCATED IN THE NC1 DOMAIN, ARE CONSERVED IN ALL KNOWN TYP IV COLLAGENS.

                                                                                                                                                               PUNCTION: MAJOR COMPONENT OF THE DESCEMET'S MEMBRANE (BASEMENT MEMBRANE) OF CORNEAL ENDOTHELIAL CELLS.
SUBUNIT: MAY FORM HOMOTRIMERS, OR HETEROTRIMERS IN ASSOCIATION WITH ALPHA 2(VIII) TYPE COLLAGENS.
TISSUE SPECIFICITY: HIGH LEVELS IN CALVARIUM, BYE & SKIN OF NEWBORN MICE, ALSO IN VARIOUS EPITHELIAL, ENDOTHELIAL AND MESENCHYMAL CELLS.
PTM: PROLINES AT THE THIRD POSITION OF THE TRIPEPTIDE REPEATING UNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS. SIMILARITY: STRONG, TO ALPHA 2 TYPES VIII AND X COLLAGENS. SIMILARITY: CONTAINS 1 C1Q DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      KPGVTGFPGPQGPLGKPGPPGEPGPQGPIGVPGVQGPPGLPGVGKPGQDGIPGQPGFPGG 332

DISEASE: DEFECTS IN COLIOAL ARE THE CAUSE OF SPONDYLOMETAPHYSEAL DISEASE. DEFECTS IN COLIOAL ARE THE CAUSE OF SPONDYLOMETAPHYSEAL DYSPLASIA (SMD). SMD COMPRISES A HETEROGENEOUS GROUP OF HERITABLE SKELETAL DYSPLASIAS CHARACTERIZED BY MODIFICATIONS OF THE SKELETAL BODIES OF THE SPINE AND METAPHYSES OF THE TUBULAR BONES. SIMILARITY: STRONG, TO ALPHA 1 AND 2 TYPE VIII COLLAGENS. SIMILARITY: CONTAINS 1 C1Q DOWAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RADIOGRAPHY

"Cuticle collagen genes of Haemonchus contortus and Caenorhabditis
elegans are highly conserved.";

Mol. Biochem. Parasitol. 37:73-86(1989).

-i- FUNCTION: NEMATODE CUTICLES ARE COMPOSED LARGELY OF COLLAGEN-LIKE
PROTEINS. THE CUTICLE FUNCTIONS BOTH AS AN EXOSKELETON AND AS A
BARRIER TO PROTECT THE WORM FROM ITS ENVIRONMENT.

-i- MISCELLANEOUS: THIS PROTEIN SHOWS 4 POTENTIAL TRIPLE-HELICAL
REGIONS, WHICH CONTAIN GLYCINE AS EVERY THIRD AND ACID.

-i- MISCELLANEOUS: IN ALL NEMATODE CUTICLE COLLAGENS, THE POLYPEPTIDE
CHAINS ARE COMPLEXED WITHIN THE CUTICLE BY DISULFIDE BONDS AND
OTHER TYPES OF COVALENT CROSS-LINKS.

CONTROLLING LATERAL GROWTH OF COLLAGEN II FIBRILS.

CONTROLLING LATERAL GROWTH OF COLLAGEN II FIBRILS.

LEGINAL TRIMERS COMPOSED OF THREE DIFFERENT CHAINS: ALPHA 1(XI), ALPHA 1(XI) IS ALPHA 1(XI) IS POST-TRANSLATIONAL MODIFICATION OF ALPHA 1(XI). ALPHA 1(XI) IS POST-TRANSLATIONAL MODIFICATION OF ALPHA 1(XI). ALPHA 1(XI) CAN ALSO BE FOUND INSTEAD OF ALPHA 3(XI)-1(XI) (BY SIMILARITY).

LATTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND A SHORT FORM; ARE PRODUCED BY ALITERNATIVE SPLICING.

LIPTM: PROLINES AT THE THIRD POSITION OF THE TRIPEPFIDE REPEATING UNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS.

LIPTM: PROLINES AT THE THIRD POSITION OF THE TRIPEPFIDE REPECTS OF SALS BY ALECTS IN COLLILAL ARE ASSOCIATED WITH CHONDRODYSPLASIA, AN AUTOSOMAL RECESSIVE DISEASE CHARACTERIZED BY SKELETAL DEFECTS CAUSED BY ABNORMALITIES IN THE CARTILAGE OF LIMBS, RIBS, MANDIBLES CAUSED BY ABNORMALITIES IN THE CARTILAGE OF LIMBS, RIBS, MANDIBLES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Li Y., Lacerda D.A., Warman M.L., Beier D.R., Yoshioka H., Minomiya Y., Oxford J.T., Morris N.P., Andrikopoulos K., Ramirez F., Wardell B.B., Lifferth G.D., Teuscher C., Woodward Taylor B.A., Seegmiller R.E., Olsen B.R.; "A fibrillar collagen gene, Collial, is essential for skeletal morphocensis".

"Mutations in COLLIA2 cause non-syndromic hearing loss (DFNA13).";
RL Nat. Genet. 23;413-419(1999).

CC -!- FUNCTION MAY PLAY AN IMPORTANT ROLE IN FIREILLOGENESIS BY
CONTROLLING LATERAL GROWTH OF COLLAGEN II FIBRILL.

CC -!- SUBUNIT: TRIMERS COMPOSED OF THREE DIFFERNT CHAINS: ALPHA 1(XI),
AND ALPHA 3(XI) ALPHA 3(XI) IS A POST-TRANSLATIONAL
CC MODIFICATION OF ALPHA 1(II).

CC ALPHA 2(XI), AND ALPHA 1(II). ALPHA 1(V) CAN ALSO BE FOUND INSTEAD
CC ALPHA 3(XI)=1(II).

CC -I- ALFERNATIVE PRODUCTS: 8 isoforms; 1 (shown here), 2, 3, 4, 5, 6, 7

CC -I- ALFERNATIVE PRODUCTS: 8 isoforms; 1 (shown here), 2, 3, 4, 5, 6, 7

CC -I- PTM: PROLINES AT THE THIRD POSITION OF THE TRIPEPTIDE REPEATING
CC -I- PTM: A DISULPIDE BONDED PEPTIDE CALLED PROLINE/ARGINIME-RICH
CC -I- PTM: A DISULPIDE BONDED PEPTIDE CALLED PROLINE/ARGINIME-RICH
CC -I- PTM: A DISULPIDE REPEASED FROM THE AMINO TERMINUS DURING
CC PROTEIN OR PARP IS RELEASED FROM THE AMINO TERMINUS DURING
CC CARPTILAGE MATREX PEROM WHICH IT CAN BE TSOLATED IN STRAIPED AND STRAIPED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pihlajamaa T., Prockop D.J., Faber J., Winterpacht A., Zabel B., Giedion A., Wiesbauer P., Spranger J., Ala-Kokko L., "Heterozygous glycine substitution in the COLI1A2 gene in the oripatient with the Weissenbacher-Zweymueller syndrome demonstrates identity with heterozygous OSNED (nonocular Stickler syndrome)."; Am. J. Med. Genet. 80:115-120(1998).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pediatr. 132:368-371(1998).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          J. Hum. Genet.
                                                                                                                                                                                                         type 3 (STL3). It is an autosomal dominant disorder characterized by oro-facial, auditory and skeletal manifestations, such as midfacial hypoplasia, cleft palate, osteoarthritis, and sensorineural hearing loss. Differently from Stickler syndrome type 1 and 2, no ocular involvement is observed. This disorder is also referred to as Stickler-like syndrome or non-ocular Stickler
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CARTILAGE MATRIX FROM WHICH AMOUNTS.

DISEASE: Defects in CCLILA2 are the cause of Weissenbacher-Zweymueller syndrome (WZS), an autosomal dominant disorder allelic with STL3 and OGMED. It is also referred to as heterozygous OSMED. DISEASE: Defects in CCLILA2 are the cause of autosomal dominant nonsyndromic sensorineural deafness type 13 (DFNA13). Affected individuals experience progressive hearing loss beginning in the second to fourth decades, eventually making use of amplification mandatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SIMILARITY: BELONGS TO THE FIBRILLAR CLASS OF COLLAY DATABASE: NAME=Hereditary hearing loss homepage; NOTE=Gene page; WWW="http://www.uia.ac.be/dnalab/hhh/hhhgenes.html"
